

Assessment of Tactical Ground Unit Technical Signature Management Procedures

Research Question: How can a unit commander best use tactical communications to accomplish an assigned mission while remaining hard to detect by a peer threat force?

Summary: Assess existing technical signature management procedures for tactical units, using existing inventories of tactical communications and other radio-frequency emitting equipment.

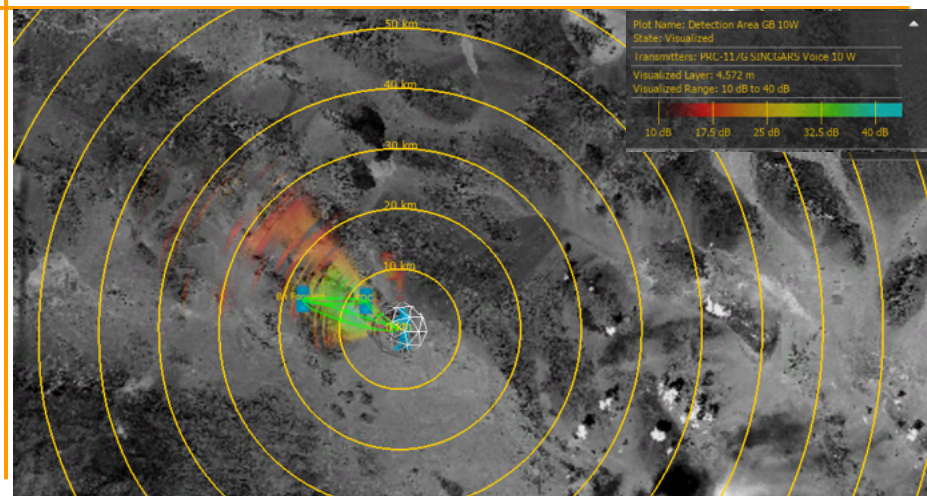

Baseline SNR Plot for AN/PRC-117G

Reduced Power AN/PRC-117G

Terrain Masked AN/PRC-117G

Directional Antenna AN/PRC-117G

NRL Builder SNR Plot from McMillan Airfield Point 5

Objective: Validate Builder Models

- Experiment 1 – Baseline Test
 - Measure Signal Strength along a single azimuth at various ranges, while varying:
 - Frequency (VHF, UHF)
 - Power
 - Body position
- Experiment 2 – Varying Terrain Test
 - Identify any trends in Builder that contribute to inaccurate models of TTPs
 - Line of Sight vs. Non-LOS
 - Elevation
 - Range

Description: Validate NRL Builder Models

- Use spectrum analyzers to capture measurements of known COTS emitters to validate computer models as an applicable planning tool
- Experiment Variables:
 - Range/Terrain
 - Frequency
 - Power
- Measure signal strength at various ranges; adjust frequency and power, compare data to computer simulation

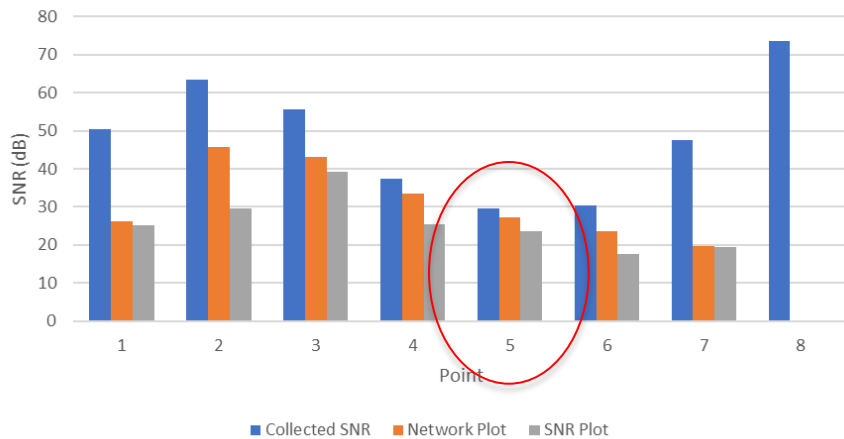

Key Participant: Joint Vulnerability Assessment Branch

Experiment Deliverables

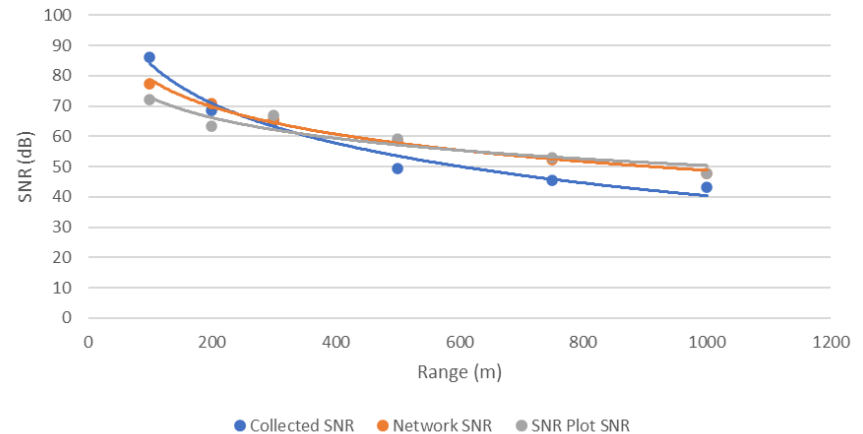

- Validating models or identifying any inaccurate trends by comparing measured data with Builder plots
- Provide insight into TTPs through spectrum analysis
- Education on real-world spectrum analysis and direction-finding systems to understand application of TTPs against enemy threats
- Provide methodology for conducting Own Force Signature Assessment for future analysis of Marine Corps unit signatures

VHF Terrain SNR at 5 W

VHF Baseline SNR at 5 W

Future Work

- Thorough analysis of Marine Corps Communications-Electronics Equipment
 - HF
 - MUOS/SATCOM
- Application of Threat Analysis (Tradeoff of Bandwidth vs. Resolution vs. Scan time)
- Comparison of RF Modeling and Simulation Programs
 - SPEED
 - STK
 - Other Software/Programs
- Analysis of Future/Emerging Communications methods and Real-Time analysis tools

Equipment

- 1 x R&S DDF05A with ADD053 (20-1300 MHz) antenna
 - Spectrum analysis
- 3 x Persistent Systems Wave Relay (MPU-5)
- 2 x Midland GXT900K (UHF Handheld)
- 3 x ICOM IC-52D (VHF Handheld)
- 3 x Garmin Rhinos 530HCx
 - GPS
- 2 x Instant Eye SUAS
